Sony's detection was delayed by three days which indicates their detection system was probably manual than automatic.

How you will stop it from spreading, like disconnecting infected systems from the network:

How you will remove the threat and get things back to normal:

Pick one type of cyberattack (e.g., malware, phishing, ransomware, denial of service), explain what it is and how it works:

List at least 3 important rules or guidelines to protect the system:

Explain how your rules and response plan support Confidentiality (keeping data private), Integrity (keeping data accurate), and Availability (making sure data is accessible when needed):
Pay attention
